$$(363+224) \% 10 = 7$$

Task 1

The following table has been extracted after updating the DNS query packets with the custom headers and then sending them to the server for DNS resolution.

This table contains the query name, the Custom header value and its resolved IP address.

The predefined DNS rules helped map the time to the resolved IP address.

1	Custom header value (HHMMSSID)	Domain name	Resolved IP address
2	01003700	wikipedia.org.	192.168.1.11
3	01003701	reddit.com.	192.168.1.12
4	01003702	apple.com.	192.168.1.13
5	01003703	twitter.com.	192.168.1.14
6	01003704	yahoo.com.	192.168.1.15
7	01003705	linkedin.com.	192.168.1.11

Task 2

In this task, we understood how the traceroute utility works in different operating systems, in our case, Windows and Linux.

‘tracert’ on Windows and ‘traceroute’ on Linux are network diagnostic tools. They show the path a packet takes when transmitted from your computer to a host.

Running ‘tracert’ on Windows Command Prompt

tracert www.google.com

```
C:\Users\nupoo>tracert www.google.com

Tracing route to www.google.com [142.251.42.68]
over a maximum of 30 hops:

  1    28 ms    2 ms    1 ms    10.7.0.5
  2    19 ms    3 ms    3 ms    172.16.4.7
  3     7 ms    3 ms    5 ms    14.139.98.1
  4     6 ms    2 ms    2 ms    10.117.81.253
  5    28 ms    59 ms   10 ms    10.154.8.137
  6    12 ms    22 ms   14 ms    10.255.239.170
  7    12 ms    10 ms    9 ms    10.152.7.214
  8    17 ms    18 ms   13 ms    72.14.204.62
  9    22 ms    15 ms   12 ms    72.14.239.103
 10    13 ms    13 ms   13 ms    142.251.69.105
 11    29 ms    68 ms   67 ms    bom12s21-in-f4.1e100.net [142.251.42.68]

Trace complete.
```

Running ‘traceroute’ on Linux Shell

Traceroute isn’t installed by default

sudo apt install traceroute

traceroute www.google.com

```
nupoor_ka@NKAssudani:~$ traceroute www.google.com
traceroute to www.google.com (142.250.71.100), 30 hops max, 60 byte packets

Questions

Question 1

In Linux, traceroute uses the TTL (time to live) field in the IP header to send UDP requests to routers in the path to the domain servers to get their IP addresses through ICMP messages.

```
LIST OF AVAILABLE METHODS
In general, a particular traceroute method may have to be chosen by -M name, but most of the methods have their simple
cmdline switches (you can see them after the method name, if present).

default
The traditional, ancient method of tracerouting. Used by default.

Probe packets are udp datagrams with so-called "unlikely" destination ports. The "unlikely" port of the first probe is
33434, then for each next probe it is incremented by one. Since the ports are expected to be unused, the destination host
normally returns "icmp unreachable" as a final response. (Nobody knows what happens when some application listens for
such ports, though).

This method is allowed for unprivileged users.

icmp      -I
Most usual method for now, which uses icmp echo packets for probes.
If you can ping(8) the destination host, icmp tracerouting is applicable as well.

This method may be allowed for unprivileged users since the kernel 3.0 (IPv4, for IPv6 since 3.11), which supports new
dgram icmp (or "ping") sockets. To allow such sockets, sysadmin should provide net/ipv4/ping_group_range sysctl range to
match any group of the user.
Options:

raw       Use only raw sockets (the traditional way).
          This way is tried first by default (for compatibility reasons), then new dgram icmp sockets as fallback.

dgram     Use only dgram icmp sockets.

tcp       -T
Well-known modern method, intended to bypass firewalls.
Uses the constant destination port (default is 80, http).

If some filters are present in the network path, then most probably any "unlikely" udp ports (as for default method) or
even icmp echoes (as for icmp) are filtered, and whole tracerouting will just stop at such a firewall. To bypass a net-
work filter, we have to use only allowed protocol/port combinations. If we trace for some, say, mailserver, then more
Manual page traceroute(1) line 214 (press h for help or q to quit)
```

The default section of the above screenshot shows that the Linux traceroute uses ICMP.

In Windows, tracert uses the ICMP echo protocol, sending ICMP Echo Requests with some times in the TTL field in the IP header to trace the routers in the path between the current device and the server of the domain being looked for.

Question 2

The entry at hop 10 shows ‘* * *’ indicating the router did not reply.

The reasons for this could include that

1. the last router reached at that hop had a firewall or security setup that prevents it from being seen or mapped
2. ICMP messages were dropped at that router due to the rate limit.

```
-z sendwait, --sendwait=sendwait
Minimal time interval between probes (default 0). If the value is more than 10, then it specifies a number in mil-
liseconds, else it is a number of seconds (float point values allowed too). Useful when some routers use rate-
limit for ICMP messages.
```

This program attempts to trace the route an IP packet would follow to some internet host by launching probe packets with a small ttl (time to live) then listening for an ICMP "time exceeded" reply from a gateway. We start our probes with a ttl of one and increase by one until we get an ICMP "port unreachable" (or TCP reset), which means we got to the "host", or hit a max (which defaults to 30 hops). Three probes (by default) are sent at each ttl setting and a line is printed showing the ttl, address of the gateway and round trip time of each probe. The address can be followed by additional information when requested. If the probe answers come from different gateways, the address of each responding system will be printed. If there is no response within a certain timeout, an "*" (asterisk) is printed for that probe.

Question 3

The UDP source port, usually starting from 33434, is incremented by 1 with every change in the probe packet.

```
default
The traditional, ancient method of tracerouting. Used by default.

Probe packets are udp datagrams with so-called "unlikely" destination ports. The "unlikely" port of the first probe is
33434, then for each next probe it is incremented by one. Since the ports are expected to be unused, the destination host
normally returns "icmp unreachable" as a final response. (Nobody knows what happens when some application listens for
such ports, though).

This method is allowed for unprivileged users.
```

Question 4

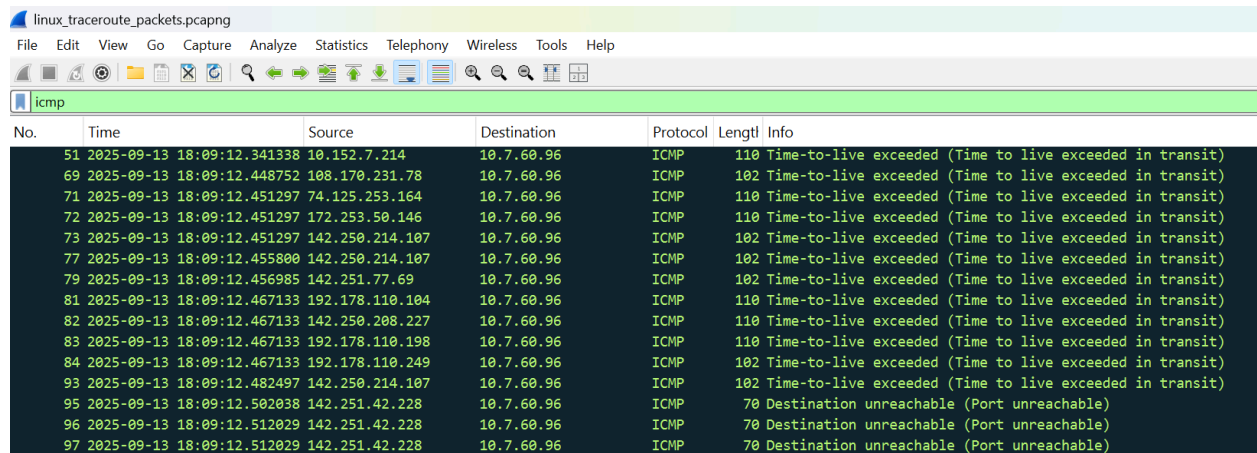

In the case of traceroute in Windows, an ICMP Time Exceeded message is received if the TTL has become zero and the destination hasn't been reached. When a probe reaches the destination, and the probe here is an ICMP Echo Request, our device receives an ICMP Echo Reply, and stops probing, having found the steps to the destination.

No.	Time	Source	Destination	Protocol	Length	Info

391	2025-09-13 18:13:47.439667	142.251.42.68	10.7.60.96	ICMP	106	Echo (ping) reply id=0x0001, seq=174/44544, ttl=115 (request in 390)
392	2025-09-13 18:13:47.442941	10.7.60.96	142.251.42.68	ICMP	106	Echo (ping) request id=0x0001, seq=175/44800, ttl=11 (reply in 393)
393	2025-09-13 18:13:47.509980	142.251.42.68	10.7.60.96	ICMP	106	Echo (ping) reply id=0x0001, seq=175/44800, ttl=115 (request in 392)

The screenshot above shows the last few packets with the ICMP layer, they are requests with responses, the three probes that reached the destination.

In the case of traceroute, used in Linux, intermediate hops receive ICMP Time Exceeded messages, whereas the final hop, one that has reached the destination with TTL>0, receives an

ICMP Port Unreachable message, as traceroute uses UDP packets with high, almost certainly unused destination ports as probes.

The screenshot shows a Wireshark packet capture of ICMP traceroute probes. The interface includes a menu bar (File, Edit, View, Go, Capture, Analyze, Statistics, Telephony, Wireless, Tools, Help) and a toolbar. The packet list pane shows 19 packets, all of which are ICMP. The packet details pane shows the selected packet (No. 19) with fields for Type (Echo (ping request)), Code (0), and Length (110). The packet bytes pane shows the raw data of the ICMP packet.

No.	Time	Source	Destination	Protocol	Length	Info
51	2025-09-13 18:09:12.341338	10.152.7.214	10.7.60.96	ICMP	110	Time-to-live exceeded (Time to live exceeded in transit)
69	2025-09-13 18:09:12.448752	108.170.231.78	10.7.60.96	ICMP	102	Time-to-live exceeded (Time to live exceeded in transit)
71	2025-09-13 18:09:12.451297	74.125.253.164	10.7.60.96	ICMP	110	Time-to-live exceeded (Time to live exceeded in transit)
72	2025-09-13 18:09:12.451297	172.253.50.146	10.7.60.96	ICMP	110	Time-to-live exceeded (Time to live exceeded in transit)
73	2025-09-13 18:09:12.451297	142.250.214.107	10.7.60.96	ICMP	102	Time-to-live exceeded (Time to live exceeded in transit)
77	2025-09-13 18:09:12.455800	142.250.214.107	10.7.60.96	ICMP	102	Time-to-live exceeded (Time to live exceeded in transit)
79	2025-09-13 18:09:12.456985	142.251.77.69	10.7.60.96	ICMP	102	Time-to-live exceeded (Time to live exceeded in transit)
81	2025-09-13 18:09:12.467133	192.178.110.104	10.7.60.96	ICMP	110	Time-to-live exceeded (Time to live exceeded in transit)
82	2025-09-13 18:09:12.467133	142.250.208.227	10.7.60.96	ICMP	110	Time-to-live exceeded (Time to live exceeded in transit)
83	2025-09-13 18:09:12.467133	192.178.110.198	10.7.60.96	ICMP	110	Time-to-live exceeded (Time to live exceeded in transit)
84	2025-09-13 18:09:12.467133	192.178.110.249	10.7.60.96	ICMP	102	Time-to-live exceeded (Time to live exceeded in transit)
93	2025-09-13 18:09:12.482497	142.250.214.107	10.7.60.96	ICMP	102	Time-to-live exceeded (Time to live exceeded in transit)
95	2025-09-13 18:09:12.502038	142.251.42.228	10.7.60.96	ICMP	70	Destination unreachable (Port unreachable)
96	2025-09-13 18:09:12.512029	142.251.42.228	10.7.60.96	ICMP	70	Destination unreachable (Port unreachable)
97	2025-09-13 18:09:12.512029	142.251.42.228	10.7.60.96	ICMP	70	Destination unreachable (Port unreachable)

The screenshot above shows that most ICMP containing packets here say TTL exceeded, except the last few which say port unreachable.

Question 5

If a firewall blocks UDP but allows ICMP, Windows tracert would work but Linux traceroute wouldn't.

This is because Windows uses ICMP Echo, which is allowed by the firewall, while Linux uses UDP, which has been blocked, so the traceroute would fail, leading to [***] for each hop.

The above screenshots show that the traceroute has the default set as UDP.
